

Executive Brief

Public-safe PLM Business Architecture reference case · v0.1.0 release candidate

A product change becomes decision-ready only when current state, proposal, discovered impacts, domain conclusions, evidence, decision scope and authority are kept separate, and linked by deterministic, case-local and historically reconstructable rules.

THE PROBLEM

Revision A -> Revision B records succession, not the complete decision basis.

It omits the exact evaluated current state, configuration and usage context, Proposed Change Scope, impact provenance, required Assessments and Evidence Uses, unresolved blockers, authority and exact Decision Scope. When these concepts are collapsed, discovered impact can be mistaken for authorised scope, Evidence for compliance, package completeness for approval permission, and escalation for a terminal Decision.

THE ARCHITECTURAL RESPONSE

Assessment Baseline	immutable captured current-state basis
Versioned overlay	exact Change Item revisions + proposed state
Impact & Assessment	provenance, obligations, conclusions and Evidence Uses
Readiness & authority	Gate B, eligibility and authority sufficiency
Decision & handover	explicit terminal disposition and derived Handover View

WHAT THE SCENARIOS PROVE

A • Authorised	Complete + eligible + sufficient authority -> explicit disposition -> DEC-A01 -> Handover.
B • Scope amendment	Discovered impact is not scope; BL-B01 is reused; two obligations remain open; no Decision.
C • Escalation	Complete and eligible package; Elevated > Standard -> HIST-C01; no Decision.

Claim boundary: bounded synthetic conformance - not company-process fidelity, enterprise completeness, general graph impact discovery or automated engineering approval.

Prototype as proof: G00-G14 15/15 PASS · 185 regression tests · 6/6 verification groups · byte-identical evidence.
